INNOVATION. AUTOMATION. ANALYTICS

PROJECT ON

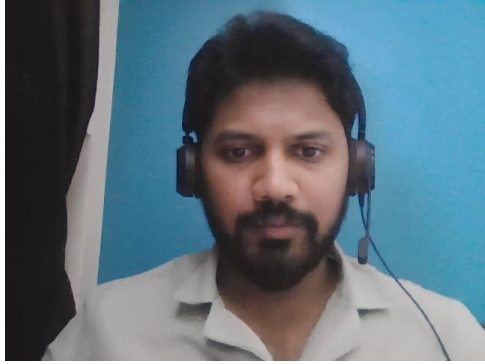

Food Delivery Business Analytics

Analysis period: 1 February 2025 – 1 August 2026

Santosh Kumar

MySQL project presentation

About Me

I’m Santosh Kumar, with a **Master’s in Strategic Project Management** from Edinburgh Napier University, Scotland, United Kingdom, and a professional background in IT Technical Support.

I’m transitioning into a **Data Analyst** role, combining my technical problem-solving experience with skills in **SQL, Python, exploratory data analysis** and **data visualization**.

My interest in analytics comes from wanting to understand business problems through data. Through projects such as this Food Delivery analysis, I examine customer activity and operational performance to develop findings that support business decisions.

INNOMATICS RESEARCH LABS

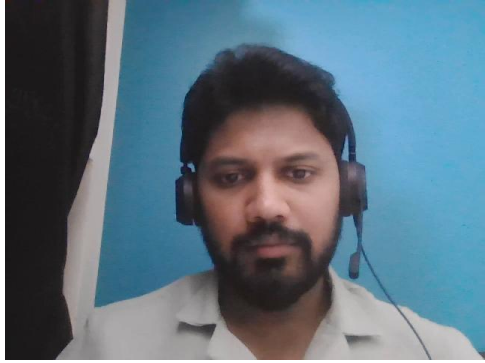

Project Agenda

- Business objective and dataset
- SQL approach and analysis questions
- Customer, restaurant and order findings
- Recommendations and limitations
- Conclusion and project challenges
- Questions and discussion

INNOMATICS RESEARCH LABS

Business objective

What affects customer activity and order completion?

Customer engagement

Find repeat customers and those who have not placed an order.

Operational performance

Compare restaurant demand, cancellations and payment results.

Scope: 43 business analyses across five project objectives.

INNOMATICS RESEARCH LABS

Project dataset and table structure

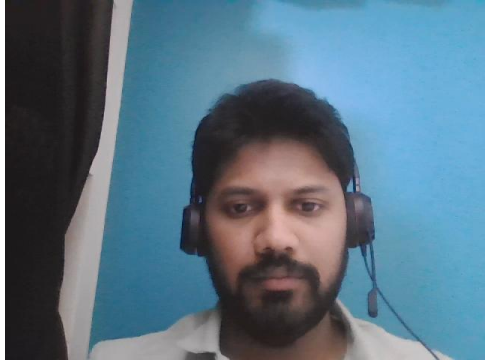

Table	Rows	Record definition
customers	500	One registered customer
restaurants	40	One restaurant
menu_items	300	One restaurant menu listing
orders	2,000	One order
order_items	5,000	One item entry within an order

Foreign keys connect customer_id, restaurant_id, order_id and menu_item_id.

INNOMATICS RESEARCH LABS

SQL approach and data validation

SQL methods

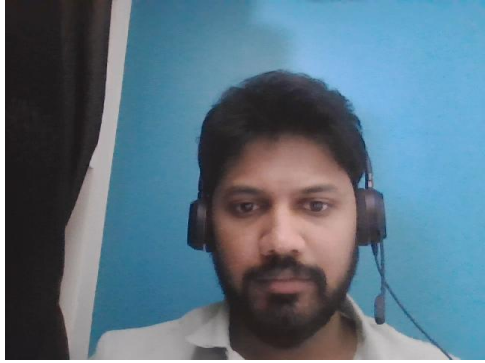

Joins connect the five tables.
Aggregations summarise orders and sales.
CASE calculates cancellation rates.
Date functions support monthly trends.

Validation controls

Imported row counts match the source.
Item subtotal equals quantity × price.
Foreign keys link valid records.
Order totals reconcile after discounts.

Order-level totals remain separate from item-level aggregations to avoid double counting.

Key Analysis Questions

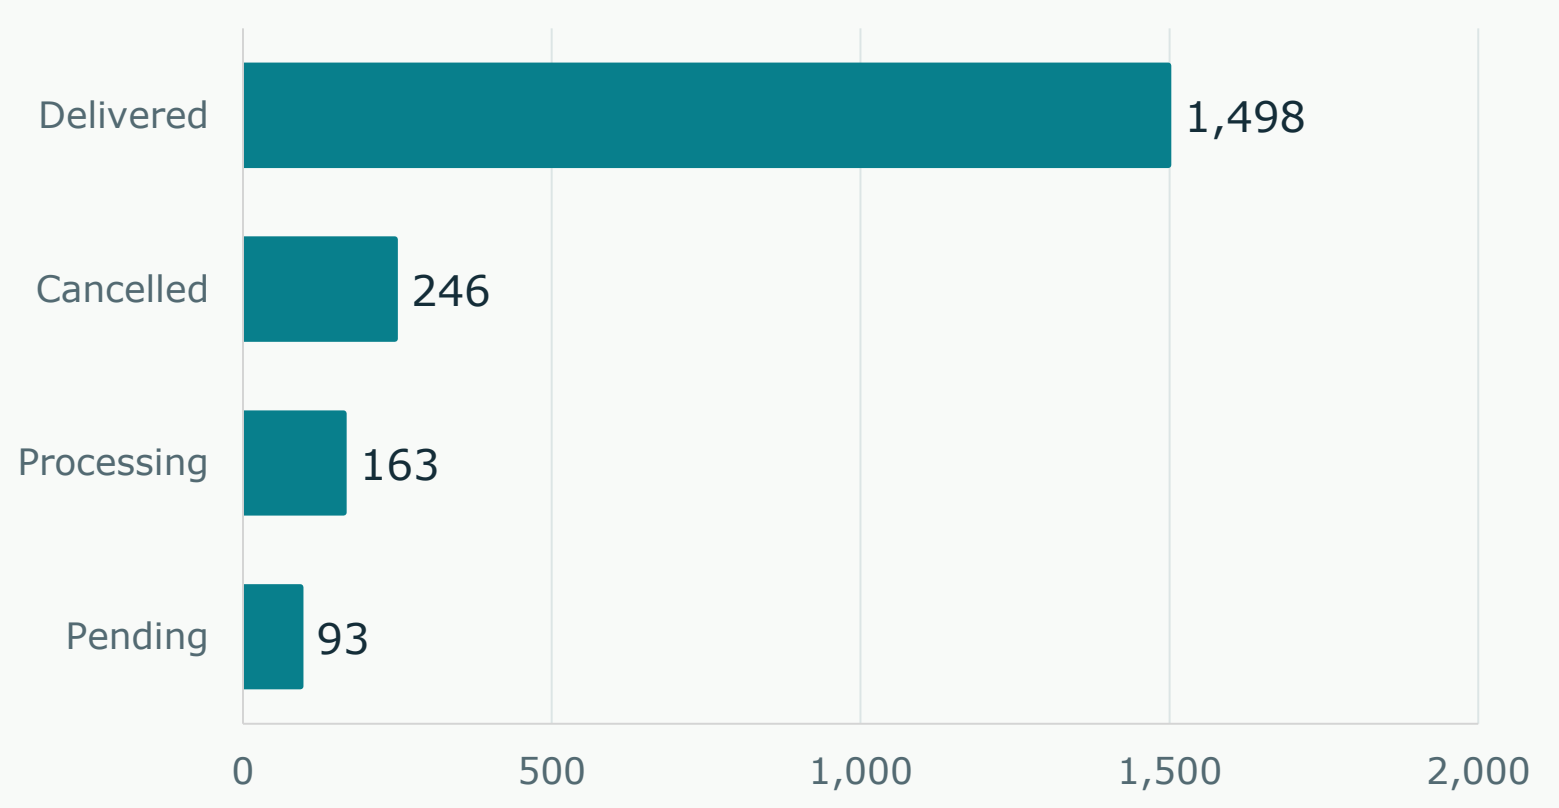

- Which customers order repeatedly or have no orders?
- Which restaurants and cuisines lead delivered order value?
- How do order volumes change over time?
- Where are cancellations and failed payments recorded?
- Which menu items sell most or have no orders?

INNOMATICS RESEARCH LABS

74.9% of orders were delivered

₹16.34 lakh

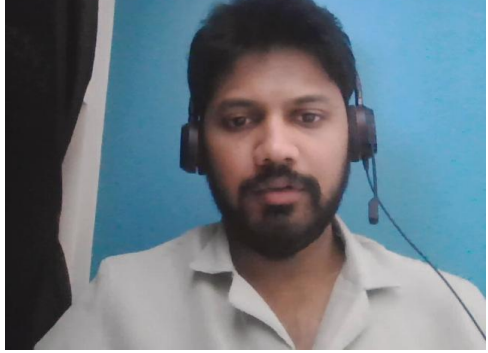

Delivered order value

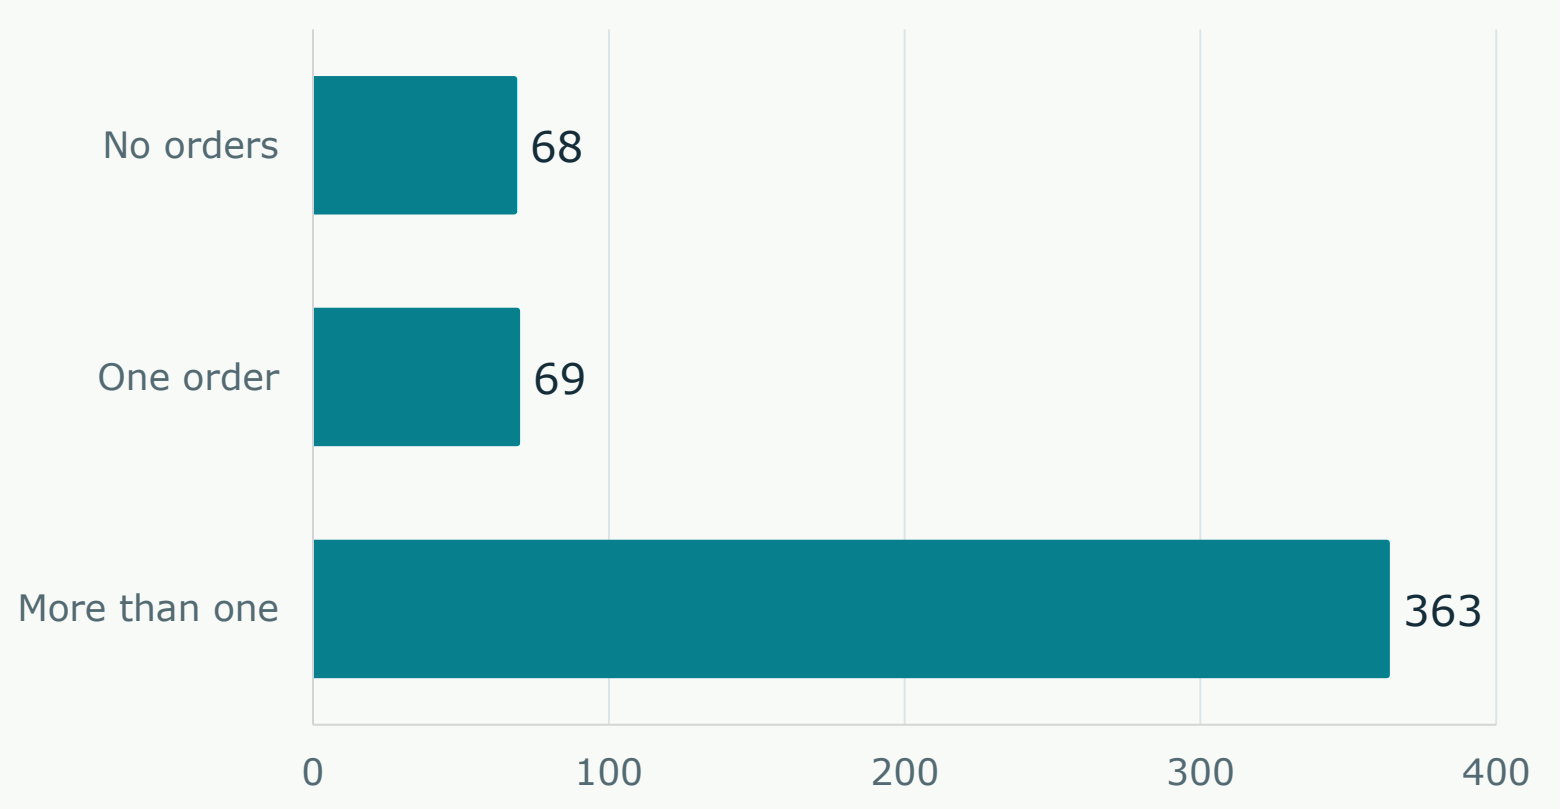

246 cancellations represent 12.3% of all orders.

All order statuses included. Exact Delivered order value: ₹16,33,864.63.

INNOMATICS RESEARCH LABS

68 customers have no recorded orders

13.6%

of customers have no orders in the dataset

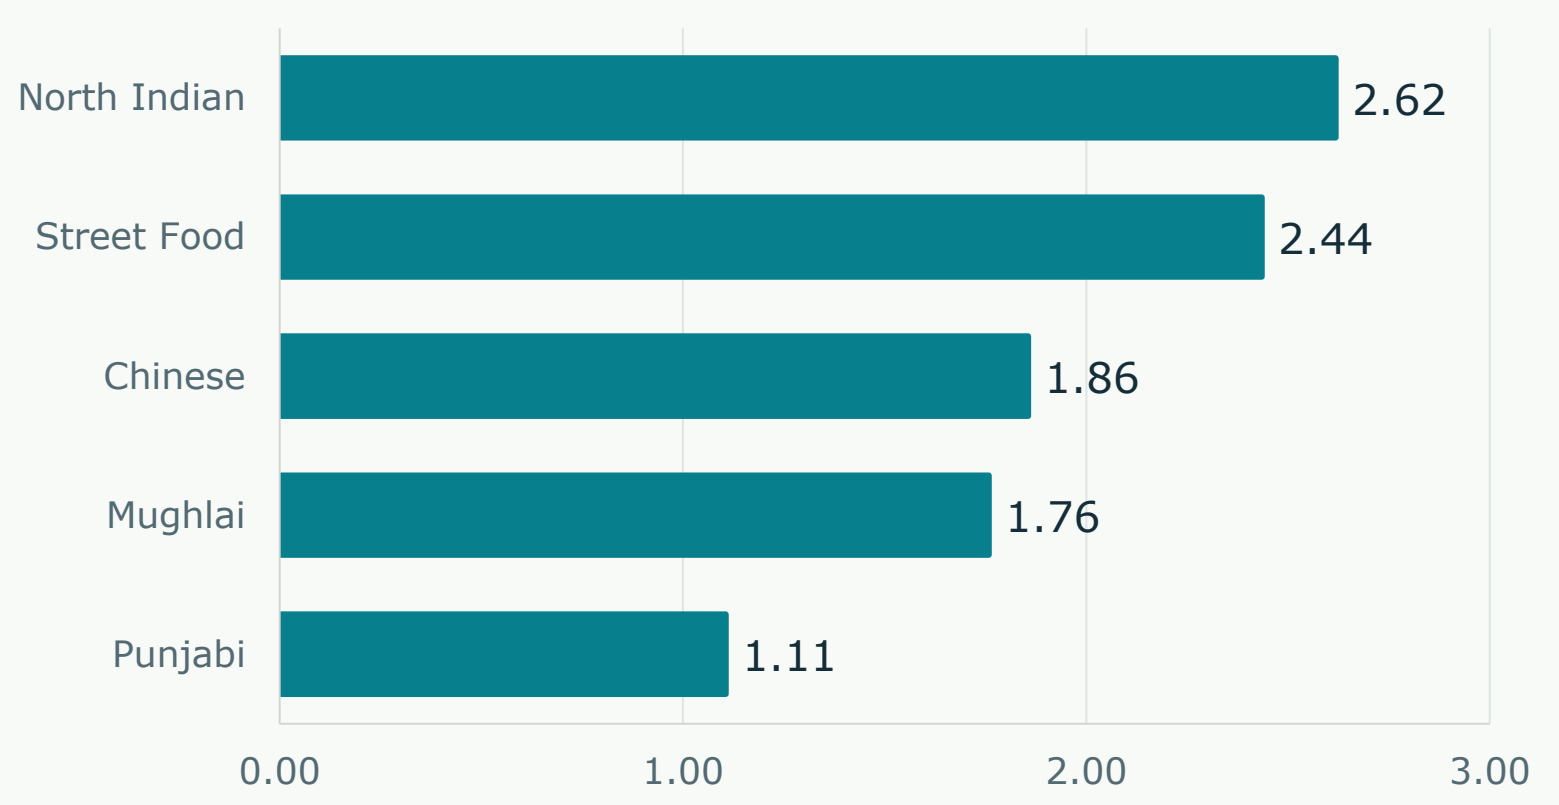

Check why these customers have not placed a first order.

500 customers in total. Counts include all order statuses.

INNOMATICS RESEARCH LABS

North Indian has the highest delivered order value

30.93%

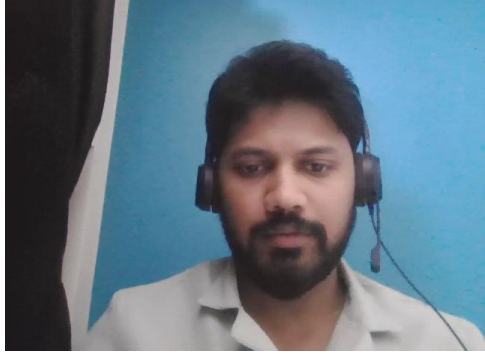

of delivered order value from North Indian and Street Food

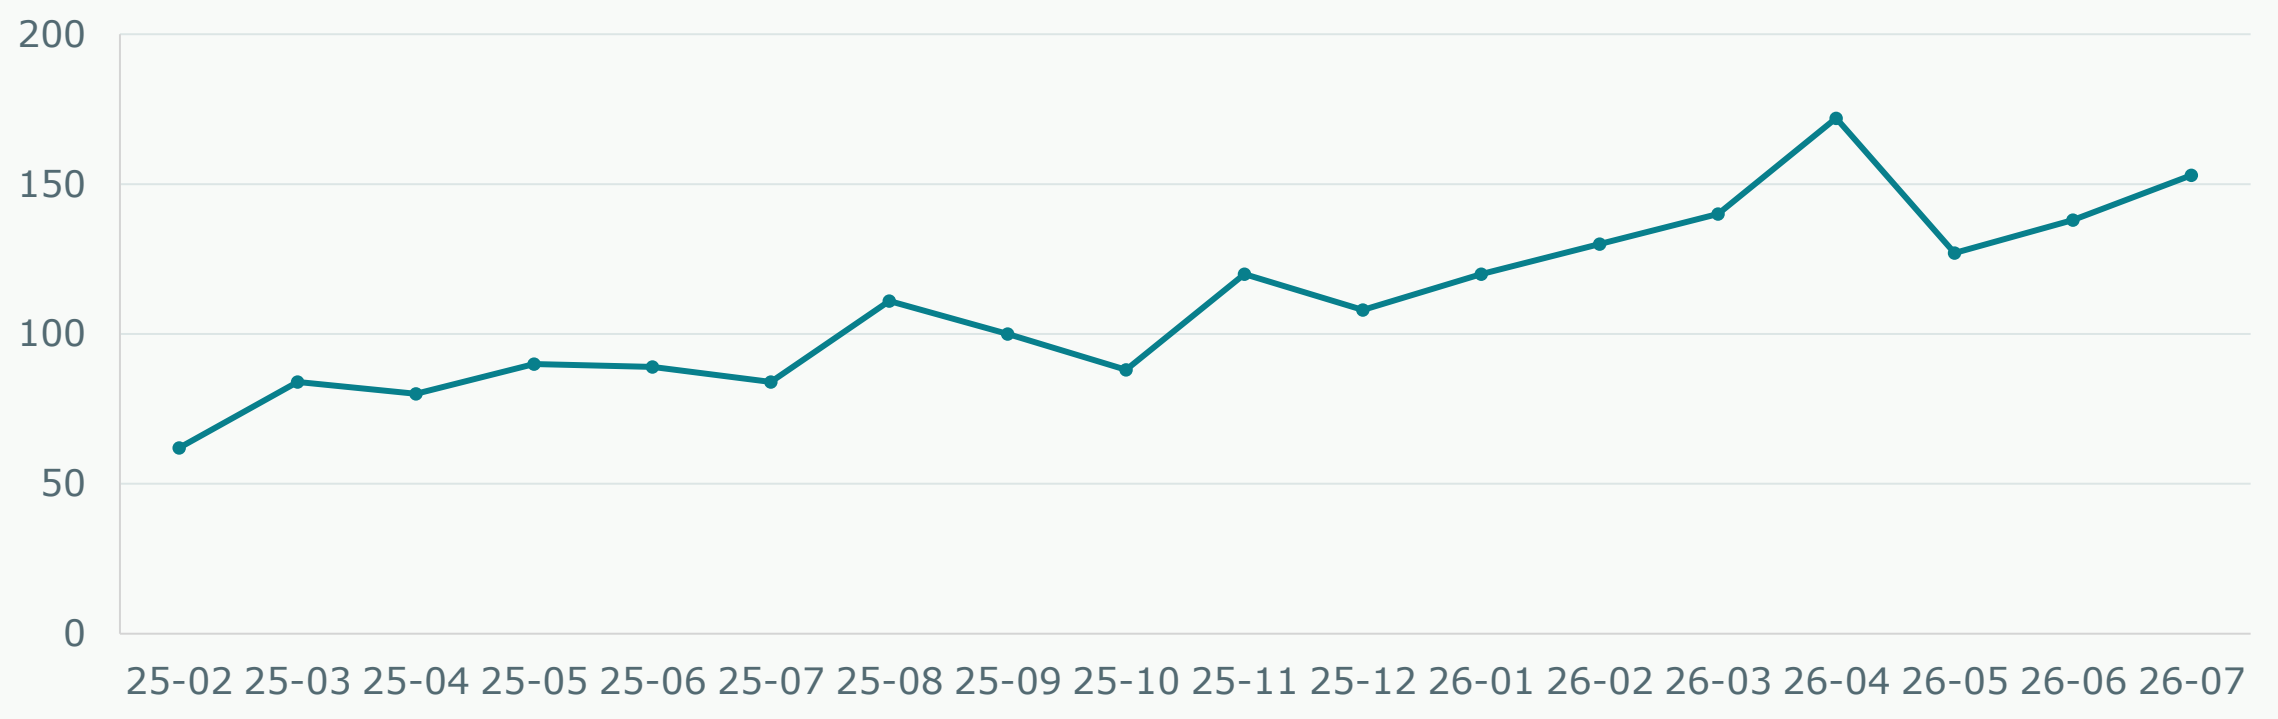

North Indian has 6 restaurants.
Street Food has 5.

Top five restaurant cuisine groups. Chart values in INR lakh.

INNOMATICS RESEARCH LABS

April 2026 has the highest monthly order count

172 orders in April 2026

Complete months only. August 2026 has one day of data and is excluded from the chart.

INNOMATICS RESEARCH LABS

Restaurant cancellations: count and rate

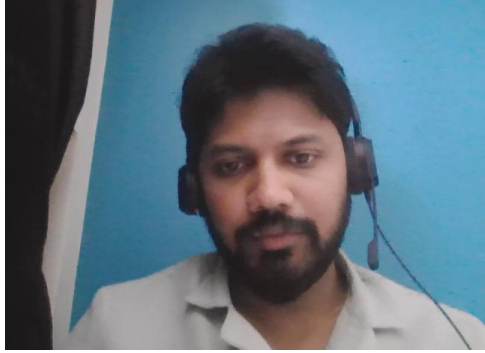

Restaurant	Orders	Cancelled	Rate
Urban Treats	16	4	25.00%
The Kitchen of Café	45	9	20.00%
Little Italy Restaurant	76	15	19.74%

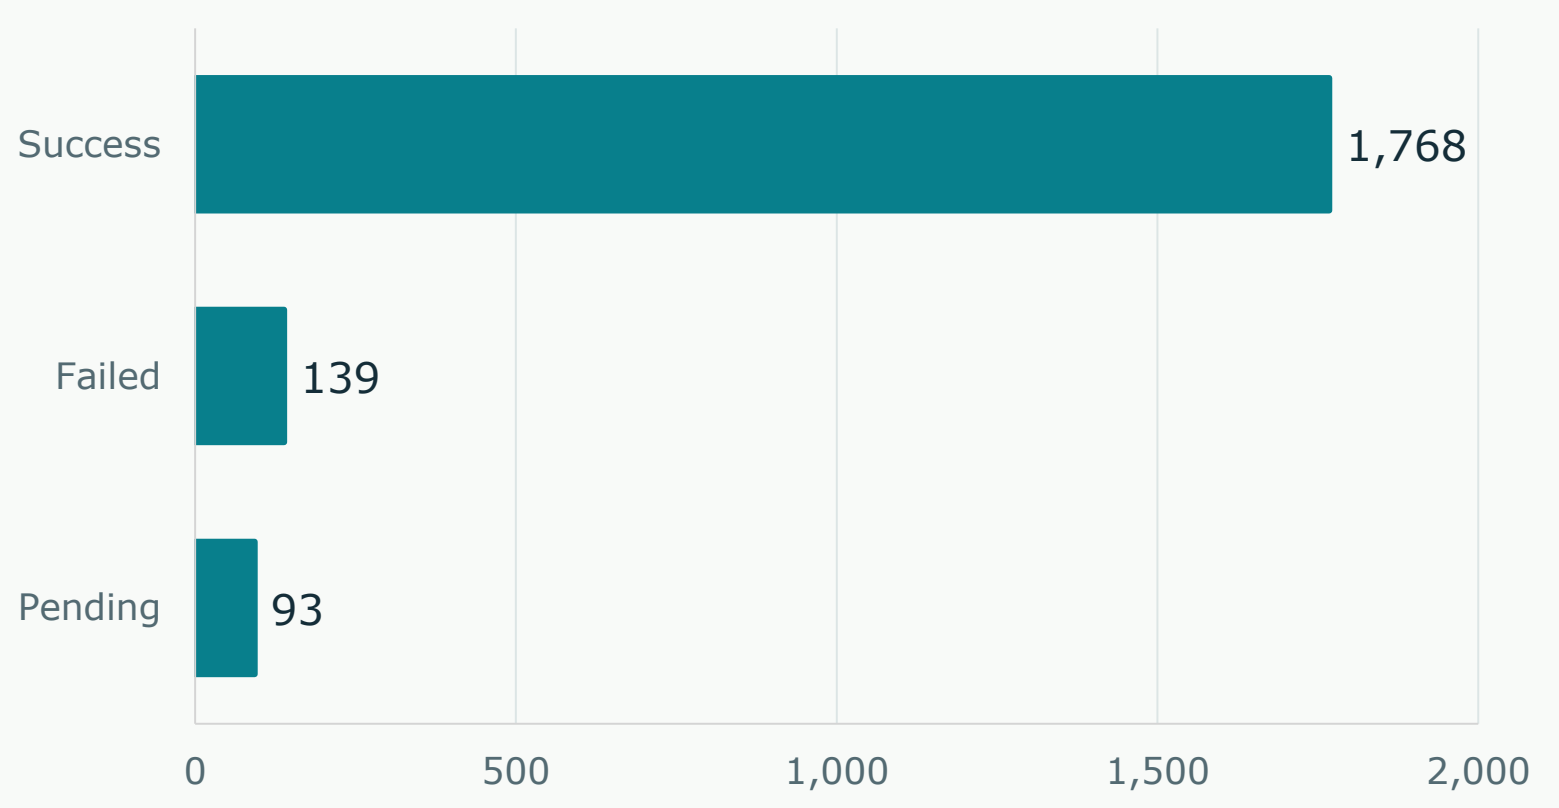

Little Italy Restaurant has the most cancellations: 15

Overall cancellation rate: 12.3%. Causes require additional operational records.

INNOMATICS RESEARCH LABS

6.95% of orders have failed payment records

139

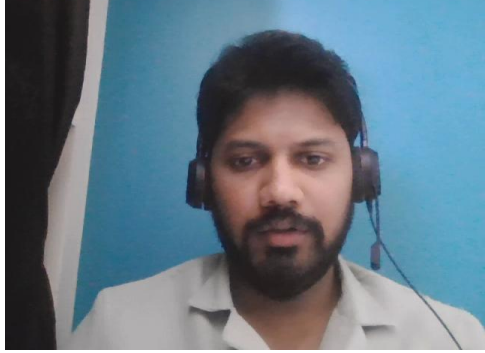

orders marked Failed

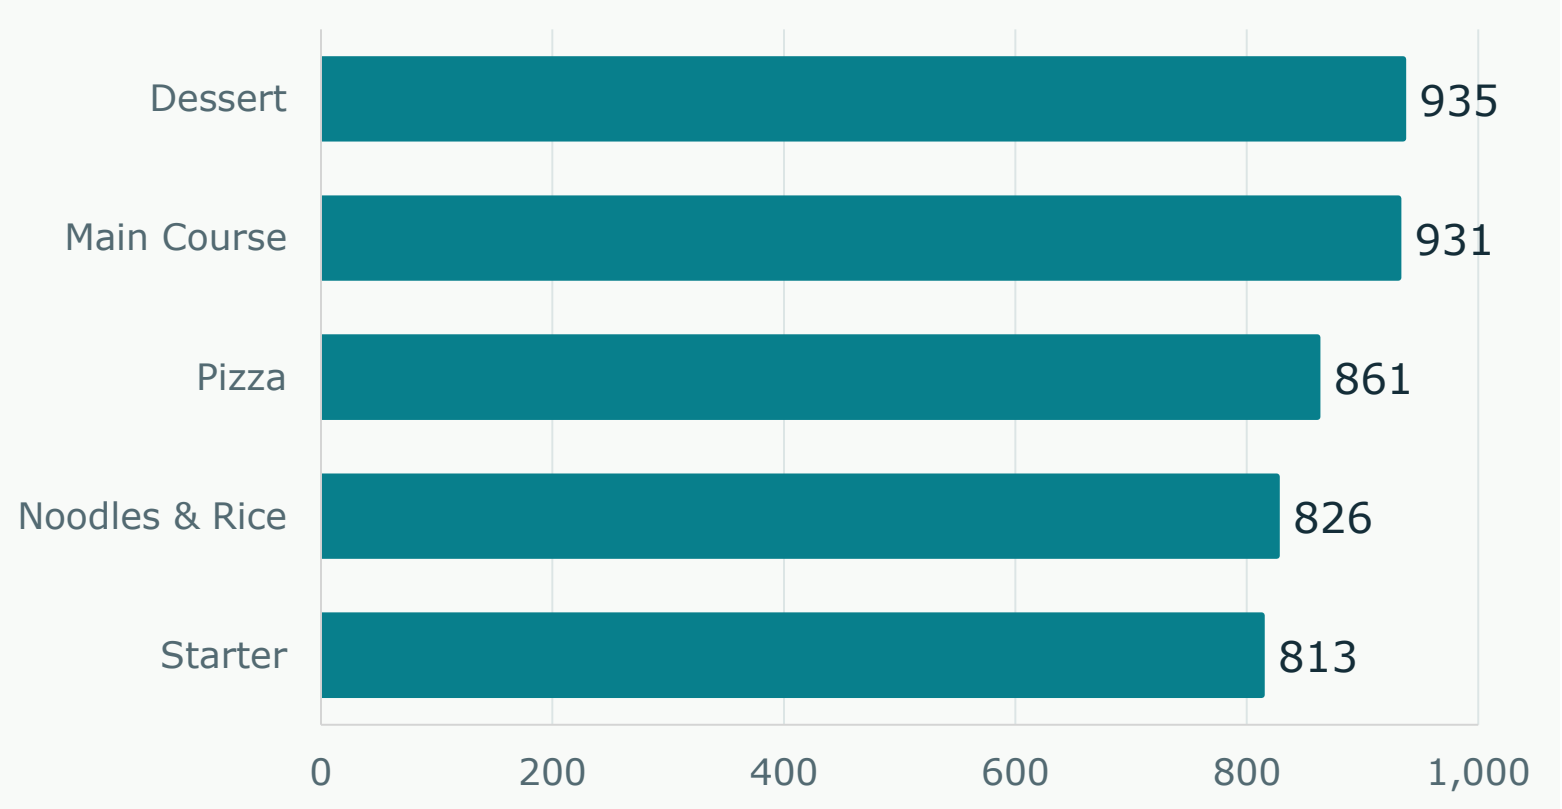

93 additional orders have Pending payments.

These counts describe each order’s payment status, rather than individual payment attempts.

INNOMATICS RESEARCH LABS

Dessert and Main Course have the most units sold

70.77%

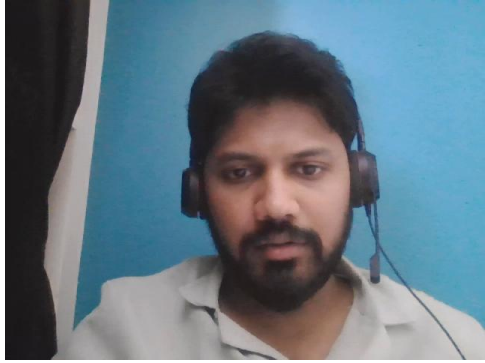

of units in delivered orders come from these categories

Dessert leads Main Course
by only four units.

Delivered orders contain 6,169 units in total. Quantities use SUM(quantity).

INNOMATICS RESEARCH LABS

19% of menu listings have no orders in the dataset

57

menu listings without any recorded order

Menu items to review

Check whether the items are available.
Review their prices and visibility.
Investigate the reason for zero orders
before changing the menu.

Separate checks identify 39 unavailable and 20 inactive items. The groups can overlap.

INNOMATICS RESEARCH LABS

Recommended actions and how to measure them

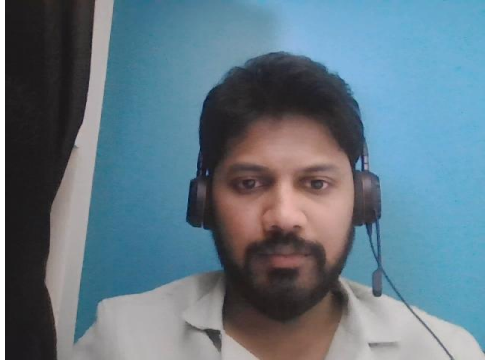

Priority	Proposed action	Measure
First orders	Test first-order support for customers without orders	First Delivered order rate
Cancellations	Review restaurants with frequent cancellations and record the reasons	Cancelled / total orders
Menu performance	Review items with no orders and test menu visibility	Delivered units per listing
Payment follow-up	Investigate Failed and Pending records by payment method	Payment success rate by method

Measure results against a baseline before deciding whether to expand these actions.

INNOMATICS RESEARCH LABS

What the data can and cannot tell us

Order value

Order value includes recorded discounts.
Costs and commissions are unavailable,
so profit cannot be calculated.

Delivery performance

Statuses show order outcomes.
Cancellation reasons and actual delivery times are unavailable.

Reporting period

August 2026 is incomplete.
Catalogue fields reflect a snapshot.

Recommendation testing

The proposed actions need testing to establish their business impact.

INNOMATICS RESEARCH LABS

Project conclusion

First orders and cancellations need attention

68 customers

without recorded orders

246 orders

cancelled in the dataset

57 listings

without recorded orders

Start with customers without orders and restaurants with frequent cancellations.

INNOMATICS RESEARCH LABS

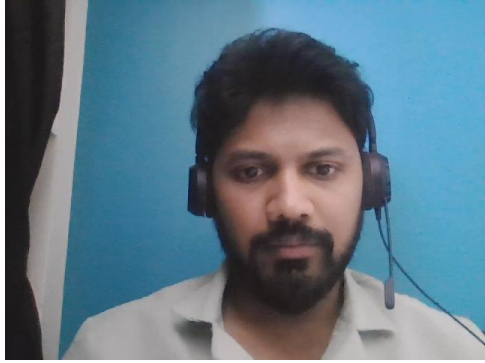

Project Experience and Challenges

- Joining five tables without duplicating order totals
- Using SUM(quantity) to measure units purchased
- Comparing cancellation counts with cancellation rates
- Excluding an incomplete month from trend comparisons
- Separating observed findings from possible causes

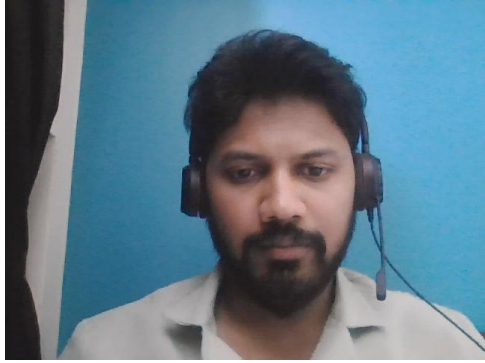

INNOMATICS RESEARCH LABS

Questions and Discussion

- How were customers without orders identified?
- Why were delivered orders used for sales analysis?
- What additional data would help explain cancellations?

INNOMATICS RESEARCH LABS

THANK YOU
